

Dynavert L – Revision of the current brochure

Loher elevator inverters of the DYNAVERT L series guarantee top reliability and riding comfort. Depending on the specifications they can be used for line voltages from 230 V to 500 V, both in combination with synchronous and asynchronous motors.

DYNAVERT L devices are modern, fully digitalized inverters with voltage-controlled intermediate circuit, efficient and convenient up to 105 kW elevator performance equipped with IGBT's in the forth generation. The inverter may be used in any environment without any problem - even in hospitals and chemical production plants.

Due to the continuous development of our inverters technical data changed for the Dynavert L in Version 06. This is now included in the existing flyer. The changes, however, can only be found in the electronic edition for now and is accessible as follows:
